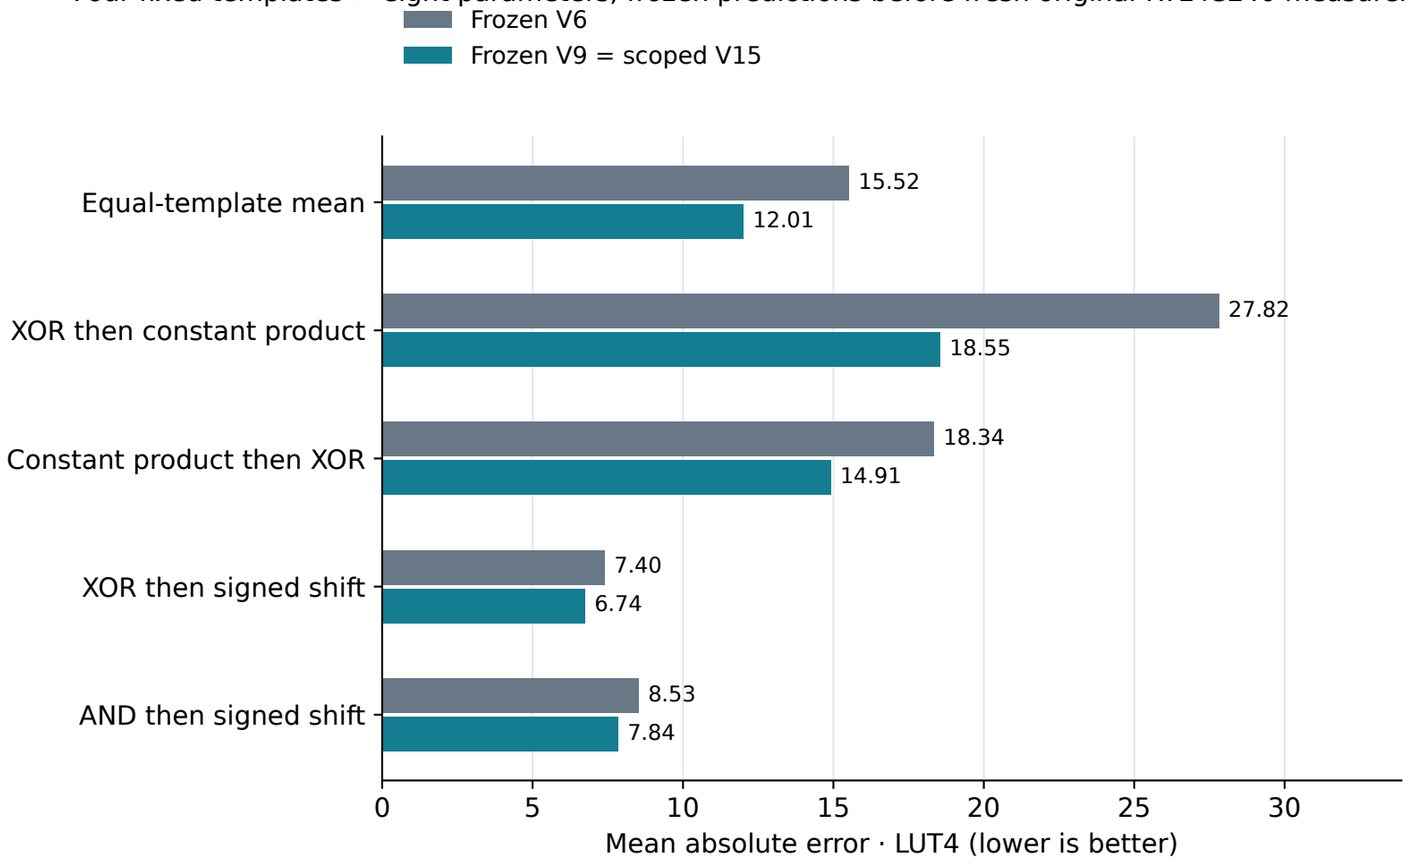
Prospective arithmetic stress: 32 verified circuits

Four fixed templates × eight parameters; frozen predictions before fresh original-RTL iCE40 measurements.



All 32 select V9 by the input-only gate, so V15 = V9 by construction. Zero new fits.
Related synthetic coverage test; no new application-transfer or router-generalization claim.

FA: predicted ≤ cap, measured > cap. FR: measured ≤ cap, predicted > cap.
All templates, threshold errors and tails retained; descriptive results, no population confidence interval.

Hardware-budget mistakes · all 32

Model	Cap	FA	FR
V6	32	0	0
V6	64	0	4
V6	128	0	0
V9 / V15	32	0	0
V9 / V15	64	0	2
V9 / V15	128	0	0

Worst underprediction, LUT4
V6: 2.83 V9 / V15: 32.01
