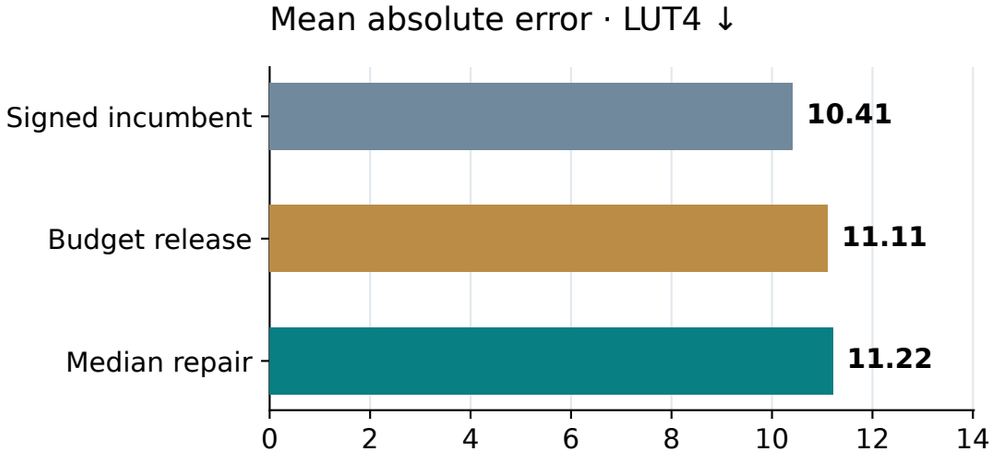
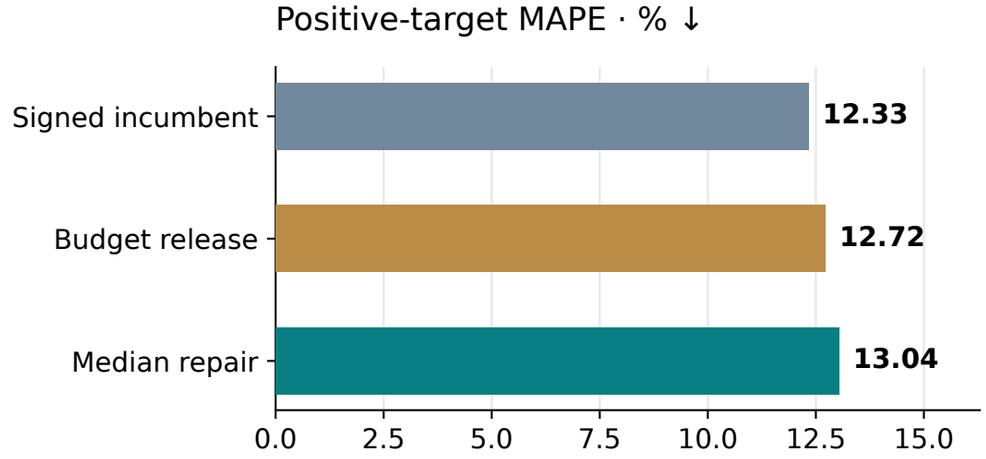
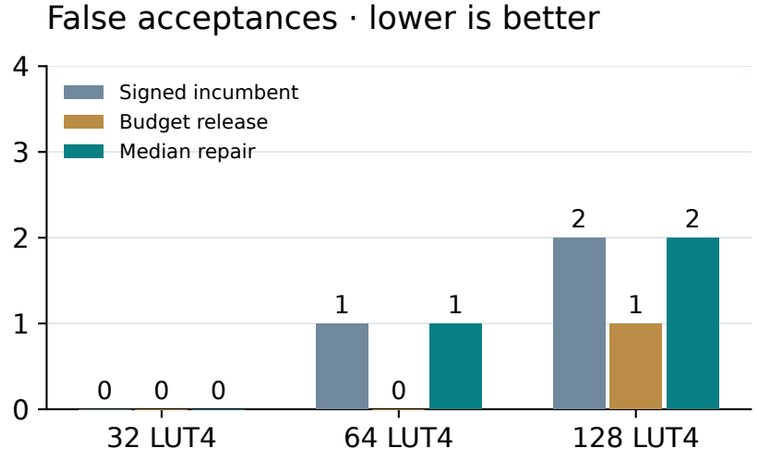
Testing the median repair where predictions disagree

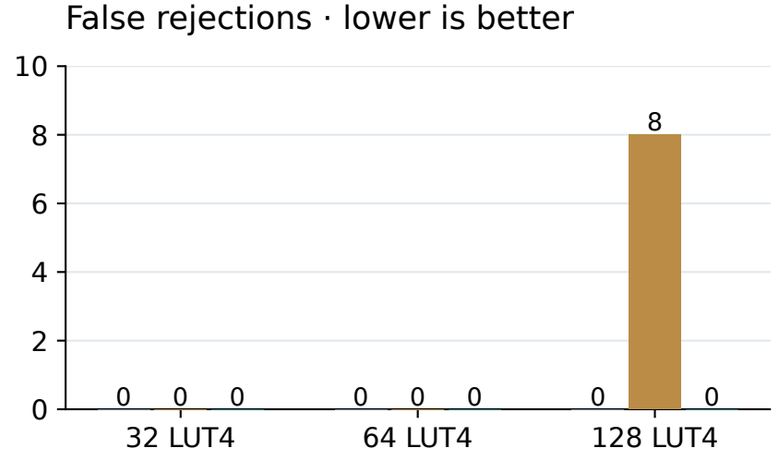
18 selected fresh circuits from a fixed 200-input pool · selection and predictions frozen before labels

Predeclared selection and fresh gates: NOT PASSED — candidate remains diagnostic









Conditional challenge: 10 changed predictions across 5 templates + 8 fixed controls.

32 LUT4: 0 feasible / 18 infeasible · 64 LUT4: 5 feasible / 13 infeasible · 128 LUT4: 15 feasible / 3 infeasible

Worst underprediction (signed → release → repair): 37.12 → 30.81 → 31.00 LUT4.

Prediction-conditioned challenge, not a population estimate. All 200 pool records retained; no pooling with the separate broad 40-case test.

Targeted isolated iCE40 area study; no calibrated safety, application-transfer, timing, power or CPU-speed claim.
